**Information:** Possible interaction between fluoxetine and risperidone, increase the risperidone!  
Interaction description in MIMS

### Reaction :

Preferred Term	Severity	Report Description	Treatment
Dyskinesia	Caused or prolonged inpatient hospitalisation	Patient was hospitalised in mid-June 2008 for management of "convulsions". Jerky, involuntary movements, including arms flung in the air, grunts. She was hospitalised for two weeks where they reduced the Epilim to zero and ceased the fluoxetine and jerky movements gradually faded away. They gradually reintroduced the Epilim and the jerky movements did not return.

**Information:** Possible increase in alprazolam levels due to fluconazole, fluoxetine and verapamil all increasing each other via CYP450 interaction, then increasing alprazolam. Possible QT prolongation as well.

### Reaction :

Preferred Term	Severity	Report Description	Treatment
Dizziness		Patient has been on Xanax for quite a while, and has been on doses as high as 1mg tds, but developed considerable tolerance to the drowsiness. A special immunologist diagnosed her "intestinal candidiasis" and prescribed the fluconazole, after commencing it her bowel symptoms have improved, however she has become really, really dizzy. In the past week she has had about seven falls just walking around the house. On the day of her call she had fallen over when she turned around "too fast" after closing the fridge door. she said "I am covered in bruises" and feels quite fragile and unsteady on her feet.	Alprazolam reduced to 0.5mg bd, then 0.5mg mane.

Syncope
