Preferred Term	Severity	Report Description	Treatment
Vision blurred		Patient commenced on methotrexate to help her asthma-she takes it on sat. mornings-would have an occasional brief dizzy feeling if she bent over etc. Once she was on the Tofranil the dizziness became much more severe and constant and she had blurred vision. It started 8-10 hours after taking the dose of MTX, and last 3-4 days, easing off by mid-week, only to return after the next dose of MTX. Reducing the dose of Tofranil means it goes away a bit quicker and it is less severe. Patient was unable to drive, concentrate or use computers, read etc while affected.	Withdrawing Tofranil.
